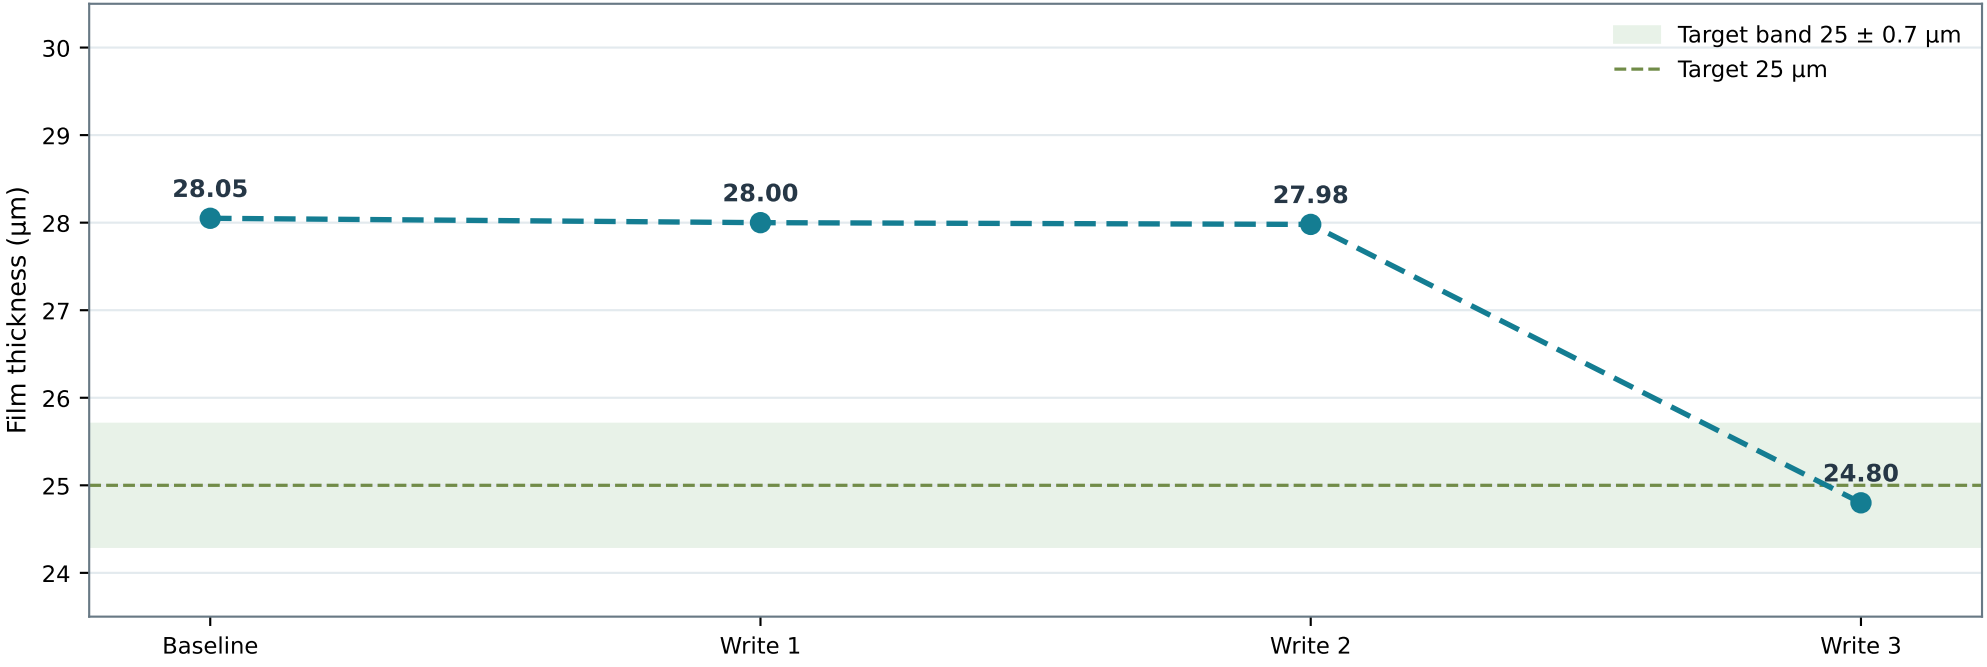
P10 · Biax multi-node tuning mission (simulator)

Measured iteration outcome; the third write enters the registered target band



Start	cast-spd-sp	fast-roll-sp	rail-out-sp
h = 28.05 µm	32 → 33.7	118 → 122.4	3000 → 3096 · target met

Writes: 3 on 3 distinct knobs; final thickness 24.80 µm (target 24.3–25.7). Dashed line only orders discrete iterations; it is not continuous sampling or causal isolation. This is a deterministic simulator mission, not physical equipment evidence. The saved summary says 0 optimization records, while the mission journal reports 1 open record for the first write; do not infer a complete per-write record chain.
