AgentWorkShop Project Operational Flow — plan v3.0 + Router v3 target design

Owner — Initiation
objective · success criteria
deliverables · channels
mode · auto-dispatch

Chief Leader Proposal
proposal-only · real LLM
work items · deps · budgets
output contracts

GATE ①
Plan Approval
locks version

Dual-Graph Materialization
contract = deliverable DAG
execution = work-item DAG
cycle / missing → reject

Route Execution Loop — Deterministic Executor

no-LLM hot path

runRouteLoop = reconcile + auto-dispatch · callback events (effectively-once) + periodic fallback

Trigger
task-callback events
tick 10s/30s fallback

Ready(W) Evaluation
DRAFT ∧ no attempt
upstream TechOK gate
capacity ∩ budget

Atomic Dispatch
DISPATCHING → CAS
handoff to downstream
capacity/budget caps

① **Channel Lead Execution**
spawn workers · aggregate
artifacts → root COMPLETED
A→B handoff relay

TRANSIENT → retry ≤3 (backoff)

content → REWORK · env → BLOCKED

all terminal ∧ TechOK?

yes ↓

② ② callback → reconcile → L0 → dependency released · loops until terminal

Three-Level Acceptance Pipeline — per deliverable, in order (Router v3 core) · Leader is the technical acceptor, not the grader

L0 Content Check — system
COMPLETED · real artifact
sha256 → content_ready

L1 Technical Acceptance — Leader
vs owner-locked criteria
evidence → technical_accepted

L2 Business Sign-off — Owner
deliverable approved (strict)
leader cannot self-approve

GATE ③ Completion Gate
owner signs · rechecks
all gates before closing

project completed
never auto-closes
artifacts · audit

Execution Workbench (5 tabs · execution section)
deliverable graph · kanban · swimlanes · trace drawer
backend stages · API↔DOM parity · SSE + polling

dispatch · callback / state · human approval gate · data / support · LLM-free guarantee

① dispatch work item (contract + handoff) · ② completion callback → reconcile → L0 → release · loops until all terminal

deterministic executor: trigger / evaluate / dispatch (no LLM) · Owner: three sign-offs · Leader: proposal + L1
